

THE PROJECT

Abstract

A third of all food is wasted — most of it **at home**, because we buy it, forget it, and bin it. **Kulpio** tracks your fridge, warns you what expires first, and helps you cook it in time — offline, in **33 languages**. Does an app like this actually cut household food waste?

Hypothesis

A household that uses Kulpio's reminders for a week will waste **fewer items** and **save more money** than a normal week without it.

Procedure

- 1 Build the app — one offline web app + one cloud server.
- 2 Recruit **3–15** households.
- 3 **Baseline week:** log food used & wasted, reminders off.
- 4 **Kulpio week:** reminders on; cook expiring food first.
- 5 Export each week as **CSV**; compare waste & money.

Waste less food · Save money · In any language

Can one small app stop a household from wasting food?

DATA · THE APP IN ACTION

△ Projected from a transparent model — **not yet a completed study**. Real numbers come from the pilot (see Procedure).

RESULTS

33
languages, full RTL

300+
tests, run offline

≈30%
fewer wasted items*

€128
saved / year*

The app is **built & tested** — one offline file + one cloud server. **projected by a model; the pilot measures the real effect.*

Conclusion

Forgetting food is an **information problem** — and software can solve it. Kulpio makes tracking food effortless and tells you what to use **first**.

Next: a native Android app and the real pilot. Free & open-source.
