

Abstract

About **one third** of all food is wasted — most of it at home, because we buy food, forget it, and throw it away. **Kulpio** is a free app that tracks your fridge, warns you what expires first, and helps you cook it in time — offline, in **33 languages**. This project asks whether such an app helps a household waste less food and save money.

Hypothesis

If a household uses Kulpio's expiry reminders for a week, it will throw away **fewer food items** and **save more money** than in a normal week without the app.

Procedure

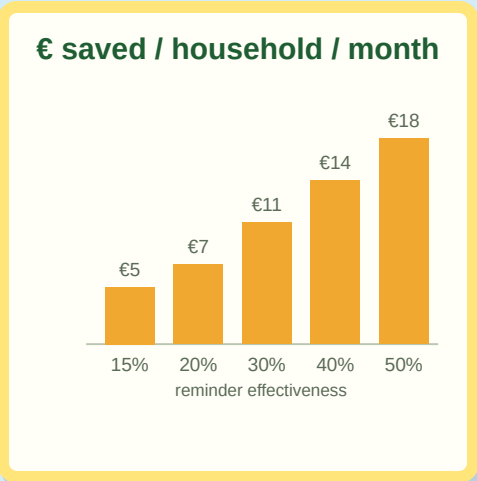

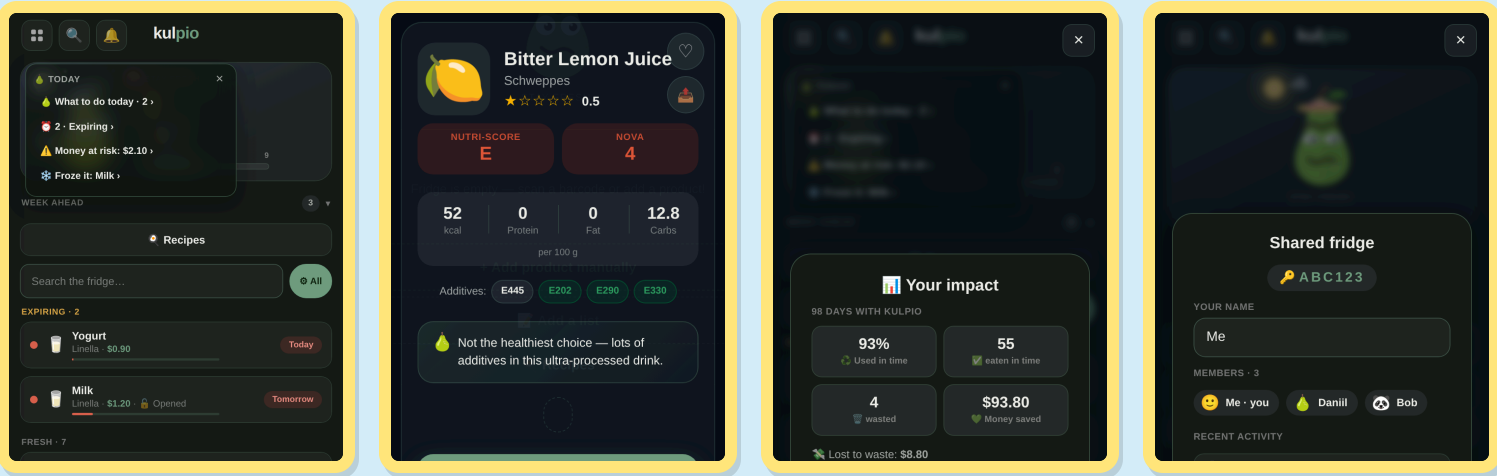

1. Build the app: one offline web app + one cloud server.
2. Recruit **N = 3–15** households.
3. **Week 1 — baseline:** log food used & wasted, reminders off.
4. **Week 2 — Kulpio:** reminders on; cook expiring food first.
5. Export each week as a **CSV**; compare waste & money.

KULPIO

Waste less food · Save money · In any language

? Can a simple phone app help a household waste less food? ?

Data

Projected impact (model)

Effect.	Waste cut	€ saved/mo
15%	15%	€5.33
20%	20%	€7.15
30%	30%	€10.71
40%	40%	€14.32
50%	50%	€17.81

⚠ The charts show a transparent **projection from a model** — not yet a completed study. Real numbers come from the pilot (see Procedure).

Results

The app is **built and tested**: one offline file + one cloud server, **33 languages**, and **300+ automated tests** that run offline on every change.

A transparent model projects that at a mid-range reminder effectiveness a household wastes **≈30% fewer items** and saves **≈€10–11 / month (≈€128 / year)**.

These are projected figures — the real effect is measured by the pilot study.

Conclusion

Forgetting food is an **information problem**, and software can solve it. Kulpio makes tracking food almost effortless and tells you what to use **first**.

Early projections suggest real savings of food and money; a pilot with families will measure the true effect.

Next: a native Android app and the field study. Kulpio is **free & open-source** and supports the UN Goals **SDG 12 · 2 · 13**.
